Abstract

This study examines the disparity between Berlin's well-established international reputation as an English-friendly city and the actual language requirements that non-German-speaking professionals encounter in the labor market. By employing a mixed-methods approach, the research combines an analysis of current job listings from various industries with primary survey data collected from international students and expatriates residing in the Berlin Metropolitan Area. The findings reveal a significant discrepancy: although the city is perceived as an accessible hub for English speakers, most full-time job listings still require proficiency in German. The survey results reinforce this observation, indicating that many non-German-speaking professionals experience rejection due to insufficient German language skills. At the same time, the perception of an English-only job market is considerably higher than what is observed. The study concludes by emphasizing that having German language skills remains a significant hurdle to employment for non-German speakers in Berlin. It advocates for a more accurate representation of the city's language job market requirements to help manage expectations and support improved professional integration.

1. Introduction

Once divided by two disparate ideologies, the German capital city of Berlin has earned a reputation for internationalism and globalization. With its thriving technology sector, growing business opportunities, and a large community of English speakers, Berlin has become an attraction for expatriates and international students looking to start a new life or career in Germany. This is primarily due to the city's branding as the ideal multicultural, English-friendly city requiring minimal German language skills. The ease with which one can navigate Berlin's historical sites, university systems, and social life without fluency in German has only reinforced the city's attractive reputation.

However, despite this welcoming image, anecdotal reports and firsthand experiences suggest significant obstacles for non-German speakers when applying for positions outside the narrow subset of expat-based tech startups. This creates a misalignment between Berlin's international image and the standard labor market's linguistic requirements. While many may assume that English is sufficient to secure a job, the reality of finding employment often tells a different story. Job listings in the Berlin Metropolitan Area continue to require fluency in German across multiple job sectors, particularly in more traditional industries such as finance, healthcare, and public administration. However, this demand is also evident in international fields like software development and marketing. This linguistic requirement creates a significant barrier to entering the German labor market, thereby challenging the perception of Berlin as a truly English-friendly city beyond a tourist scope.

This paper aims to explore the question **“To what extent does Berlin’s international and English-friendly reputation reflect the linguistic requirements of its labor market for non-German speaking professionals?”** Specifically, this will be done by:

O1: Examining the gap between Berlin's image and the language demands of its job market;

- O2:** Investigating how English-speaking professionals fare in the job market;
- O3:** Identifying which sectors or industries are more accessible to non-German speakers.

Additionally, the study argues that:

- H1:** A majority of full-time job listings in Berlin require German-language proficiency;
- H2:** Non-German-speaking professionals are underrepresented in Berlin’s non-startup employment sectors;
- H3:** The perception of Berlin as an English-speaking job market exceeds the actual availability of English-only roles;
- H4:** Students and early-career professionals experience greater language-related employment barriers than those in technical or international business roles.

Furthermore, this paper will compare the relationship between Berlin’s online reputation and online job boards, career advisors, and first-hand job-search testimonials. The use of primary research will provide contemporary insight into the topic at hand as well as represent the diversity of Berlin’s human talent. Additionally, secondary research into this question will furthermore support this paper’s analysis of Berlin’s job market. However, it is essential to note the limitations of each method. These limitations will be further elaborated upon in the methodology section of this paper.

2. Literature Review

2.1. Berlin’s International Image

Berlin has meticulously crafted a portrait of vibrancy and multicultural friendliness. As “Germany’s multicultural capital, [Berlin] is home to people from over 190 countries, creating a unique environment where many languages are spoken, and English is often understood” (Kummuni, 2025). Streamlined visa policies tailored for highly skilled workers, the proliferation of numerous start-up incubators offering many English-language networking opportunities, and a dynamically expanding tech ecosystem actively recruit a diverse international workforce. Berlin “even has an area called ‘Silicon Allee’” (Palacios, 2025), further reinforcing the city’s global image. Bertelsmann Stiftung (n.d.) also

notes that this multifaceted effort has been successful in attracting a diverse range of international talent, thereby contributing to the city’s cosmopolitan character.

However, despite the city’s immense efforts to appear English-friendly, language remains a significant barrier to employment. According to Berbée and Stuhler (2024), proficiency in the local language has a direct and robust correlation to improved market outcomes, such as better wage levels and enhanced occupational attainment. “Improved German language skills effectively reduce the employment gap and the initial wage gap” for immigrants (Berbée and Stuhler, 2024). This means that while English may unlock certain paths, a strong command of the German language is an indispensable qualification for a more entangled economic integration.

2.2. Language and Employment in Globalized Cities

One of the most consistent findings across multiple studies is the significant role that German language proficiency plays in influencing labor market outcomes for immigrants in Germany. German language proficiency is among the most crucial factors influencing employment and earnings among immigrants, especially for those outside the startup or academic sectors (Berbée and Stuhler, 2024). The increasingly persuasive interconnectedness of a globalized world has immensely reshaped labor markets, labeling proficiency in the local language as a critical determinant for employment, especially for expatriates seeking employment (Shohamy, 2006). The demand for multilingual employees has risen with the rise of globalization. This is because multinational corporations expand their reach to engage with a global clientele, thus creating a need for a widely accepted lingua franca (Mufwene, 2012). Consequently, the English language has indisputably emerged as the dominant “global language of business” (Neeley, 2012), serving as the primary medium for international communication.

2.3. Previous Research on Language Requirements

Gogolin (2002) argues that European nations underestimate the actual linguistic diversity within their borders, thus neglecting the languages brought through immigrant integration. There is an “expectation that immigrants adapt to their new place of

residence, also in the sense that they give up their inherited languages and ‘convert’ to the majority language” (Gogolin, 2002). This can further support Berbée’s and Stuhler’s claim that immigrants must learn the local language to integrate into the workforce. Gogolin highlights a hierarchy of language status in diverse contexts where German is the “dominant language.” To complement, Extra (2010) highlights the importance of “[the] widely spoken home language” as an indicator of linguistic diversity. He argues that such linguistic diversity can often challenge monolingual mindsets and function as “agents of change” (Extra, 2010).

2.4. Perception vs. Reality in Germany’s Job Market

Even in companies where English is the official corporate language, German frequently remains the primary language used for communication between German colleagues (Erling and Walton, 2007). This creates a gap between the expectation of an English-only environment and the reality where German language skills are an absolute must-have characteristic. “In the past, companies conducted most of their business in German, and employed [few English-specialists] where they were most needed,” write Erling and Walton (2007), noting that nowadays, “knowledge of English is necessary for communication with people from all over the world.”

Similarly, Extra (2010) further suggests that while cities may be linguistically rich and informal in social settings, public institutions continue to operate in a monolingual manner. Formal and official communication from government entities, such as the Foreigners’ Office, Federal Employment Agency, and Tax Office, remains primarily conducted in German (Kummuni, 2025). Significant obstacles also exist for entry into non-tech or non-startup sectors outside of the comparatively sheltered and very English-friendly tech and startup bubble. A strong and frequently validated command of the German language is required by practically all traditional sectors, such as public services and regulated professions like human resources, accounting, law, and medicine (Palacios, 2025). “Jobs that require you to know or work with German laws are the least likely for you to get without speaking German” (Palacios, 2025). On the other

hand, Damelang and Haas (2012) highlight that “young foreigners and Germans face significantly lower barriers for employment entry in culturally more diverse German regions.” This perspective argues that international and diverse areas, such as Berlin, have “lower barriers for employment entry” (Damelang and Haas, 2012).

2.5. Research Gap

While literature addresses Berlin’s international appeal and the importance of local language proficiency for immigrants in Germany, a research gap persists in directly comparing Berlin’s perceived English-friendly job market with the actual linguistic requirements faced by non-German-speaking professionals across various sectors. Prior research has examined the gap between expectations and reality in German workplaces, where English is the official language. Still, German is often used, alongside the monolingual nature of public institutions. However, a comprehensive analysis quantifying this misalignment through job listing analysis and accounts from non-German-speaking job seekers in Berlin, beyond technology and startups, remains limited. This paper aims to fill this gap by providing insights into the challenges faced by this demographic within Berlin’s labor market.

3. Methodology

To address the study’s research question, this paper employs a *mixed-methods approach*, combining primary and secondary research strategies. This will provide a comprehensive perspective on how language impacts employability in Berlin, especially for individuals who are not fluent in German. Additionally, this mixed approach will enable a comparative analysis of secondary works and contemporary testimonials as of the summer of 2025.

3.1. Primary Research Methods and their Limitations

Primary data was collected via an online survey distributed through university mailing lists, online forums, and social media platforms. The survey was created using Microsoft Office Forms (see Appendix A). It targeted expatriates and international

students and was conducted anonymously with informed consent provided through a data protection disclaimer (datenschutzhinweis) written in both German and English. Additionally, the survey includes sections on demographics, academic background, employment preferences, language skills, and job search experience. Thus, the survey enables the collection of both statistical trends and subjective perceptions regarding the role of language in Berlin’s job market.

Primary research aids and benefits this paper by ensuring contemporary data is included. The survey used in this paper allows this research to “avoid unreliable information from outside sources” (Indeed, 2025). However, primary research comes with its respective challenges (Karunaratna et al., 2024). The survey conducted in this study was particularly time-consuming and difficult to distribute. Issues arose when trying to convince individuals to take a few minutes to complete the survey, as many had refused to participate in such a study without an incentive. Also, the sample size was limited due to the difficulty in distributing the survey to the substantial number of Berlin residents. Some respondents may also downplay the issue of language requirements if they receive help from within their company, or, conversely, exaggerate the problem due to negative experiences during the hiring process.

3.2. Secondary Research Methods and their Limitations

Secondary data were collected through a content analysis of job listings on platforms such as LinkedIn, Indeed, StepStone, and businesses’ direct hiring portals. The listed jobs span various industries, including technology, marketing, education, healthcare, customer service, government, and finance. Each job listing was analyzed to determine the language in which it was posted, the language requirements listed, the industry, and the industry level. This data helps evaluate how frequently English-friendly positions are advertised, which industries offer such positions, and whether German language skills are a formal prerequisite or an implicit expectation. Notably, this paper does not aim to explore the differences in salaries and job benefits between positions that require proficiency in the German language and those that require little or no knowledge of the German language.

Secondary research is a crucial component of any study, providing valuable insights into the discoveries made by other institutions on a particular topic. It is an easy, cost-effective, and fast method of data collection that does not require “[involvement] in developing complicated data collection methods” (Nasrudin, 2025). Especially with the rise of generative AI tools like ChatGPT, secondary research has become increasingly straightforward; it simply requires a quick prompt instructing an AI tool to search the internet for sources on any given topic. Moreover, secondary research is more diverse, allowing a wealth of data to be utilized for comparison. However, secondary research also has its drawbacks. For instance, the data may be inaccurate, as no piece can ever be fully verified as authentic. It may also be outdated, offering information that no longer aligns with current industry norms and requirements (Nasrudin, 2025).

3.3. Applications of Previous Research

This study combines quantitative job listing analysis with qualitative surveys, informed by research on language in employment. It highlights German language requirements in job postings and their impact on job seekers, considering Germany’s multilingual environment, where English is viewed as a corporate lingua franca alongside German. The survey explores language proficiency, job search strategies, and perceptions of Berlin’s English friendliness, based on theories of linguistic integration by Shohamy (2006), Mufwene (2012), and Neeley (2012). Gogolin’s (2002) insights on immigrants adopting the majority language also inform how this impacts Berlin’s labor market.

4. Results and Discussion

4.1. Job Listing Analysis

An analysis of 191 Berlin job listings (see Appendix B) revealed that 75.4% specified listings required at least conversational German (19.9% conversational, 55.5% fluent), while 24.6% required none. Fifty-two percent of listings were posted in English, 47.1% in German, and 0.5% in both. This contrasts with national data indicating that 97% of jobs require German (Jones, 2025). While the sample shows a greater presence of English, a significant German barrier persists, challenging Berlin’s perceived friendliness to English

speakers.

4.1.a Information Technology

Of 44 IT listings, 34.1% needed no German, 25% required conversational German, and 40.9% needed fluent German. Sixty-five postings were in English. This sector is English-friendly, with many platforms listing English-speaking roles. Many tech companies foster “English-speaking environments,” creating an English-speaking “bubble”.

4.1.b Finance

Of 37 finance listings, 62.2% required fluent German, 13.5% conversational German, and 24.3% no German, with 48.6% being listed in German. This indicates that finance roles, particularly those involving German regulations, often require German fluency.

4.1.c Healthcare

Core medical professions require German exams (B2-C2). Primary data shows that roles like ‘Medizinische Fachangestellte’ require fluent German. Bureaucratic tasks are primarily in German. This represents a life-critical language barrier.

4.1.d Education

The English teaching market is peculiarly saturated. Certified teachers in public schools require proficiency in fluent German. Primary data shows mixed requirements (33.3% none, 16.7% conversational, 50% fluent), with 70.8% of listings posted in English.

4.1.e Public Services

Of 24 public service listings, 58.3% required fluent German, 12.5% conversational German, and 29.1% required none, with 50% listed in English. Public service roles almost universally require proficiency in German due to the state administration and bureaucracy.

4.1.f Manufacturing

Of 23 manufacturing listings, 65.2% required fluent German, 21.7% required conversational German, and 13% required no German proficiency. With 39.1% of

being listed in English and 4.3% being listed in both languages, this suggests that blue-collar work, such as manufacturing, tends to require proficiency in German for ease of communication.

4.1.g Marketing

Of 29 listings for marketing, 48.3% required fluent German, 34.5% required conversational German, and 17.2% required none. Forty-eight percent of listings were in English. This suggests that German businesses tend to market primarily to German-speaking consumers, rather than international customers, given that the majority of positions require proficiency in the language.

4.2. Survey Findings

4.2.a Demographics, Language Proficiency, and Perceptions of Respondents

The survey gathered **130 responses** through Microsoft Office Forms from young professionals and students, primarily aged 18-25 (69%) and 26-35 (23%). Most respondents held or were pursuing a bachelor's degree (54%), while the remainder held or were working towards a master's degree (46%). Many respondents were from Gisma University of Applied Sciences, reflecting the demographics of international students and expatriates. A significant majority (69%) of participants reported Beginner (A1-A2) proficiency in German, with 15% having no German skills. Additionally, 73% were fluent in English, while the remaining 27% possessed intermediate (B1-B2) English skills.

This linguistic profile, which indicates a highly educated group with strong English but limited German, supports the argument that Berlin attracts English-speaking professionals who are underprepared for the broader German-speaking labor market. Respondents indicated that only a tiny number of job listings did not require German language skills. Sixty-two percent reported that only 0-25% of job listings in their desired field were posted in English, with 19% reporting 26-60%. In further support of the assertion that German is almost always required in the workplace, 42% stated that German was always required in their field, while 38% said it was often necessary. This inconsistency between Berlin's English-friendly reputation and its actual job market outlines the widespread reality for job seekers, creating an imminent employment

challenge.

4.2.b Impact of German Language Skills on Job Searches

Sixty-nine percent of participants reported job application rejections due to insufficient German skills. Only 12% were able to secure employment without fluency in German, primarily in the hospitality and information technology sectors. Additionally, 31% were not invited to any interviews, suggesting that language barriers hinder initial screening and indicating limited English-only opportunities. This empirical evidence supports the claim that language proficiency has a significant impact on employment.

Before relocating to Berlin, 50% of participants believed they could find a job there without speaking German, which aligns with the city's image. However, when asked if Berlin's English-friendly reputation accurately reflects the job market, 50% stated that this was not true at all, while an additional 23% expressed that it was only slightly true. This stark contrast reveals a significant gap between reputation and reality. Berlin's marketing creates unrealistic expectations that lead to frustration and dissatisfaction for expatriates and international students.

4.3. Analysis

The study reveals a significant gap between Berlin's image as an English-friendly city and its labor market realities. Survey respondents report a shortage of English-only job listings (0-25% for 62%), aligning with national data indicating that 96-97% of postings require German proficiency. An 88% rejection rate due to inadequate German skills highlights the linguistic demands in most sectors. The success rate for non-fluent German speakers demonstrates a labor market where English-only positions are rare. While English suffices in tourism, it is insufficient in traditional industries and public services, which are primarily conducted in German. Despite Berlin's marketing as an English-friendly city, actual labor market conditions require German proficiency, posing challenges for non-German speakers. A lack of German skills hinders career advancement and income growth. Proficiency is crucial for navigating bureaucracy and internal communication. New residency regulations mandating German proficiency formalize this

situation, acting as a socio-economic gatekeeper and relegating non-German speakers to a secondary labor market with limited integration opportunities.

Berlin’s competitive market faces an oversaturation of English-only job openings. Recruiters often seek a “perfect fit,” including one that matches their language preferences. Daily life and administrative tasks remain predominantly German-speaking. Implicit German expectations can lead to rejections, and employers may exhibit statistical discrimination. This often limits qualified international professionals to low-skilled roles, leading to underemployment.

The tech and startup ecosystem offers the best path for English-speaking professionals, particularly in software development and AI. Learning German is vital as it broadens job opportunities and enhances career prospects. Government language courses boost employment opportunities. Berlin presents an English-friendly image but reveals a German-dominated reality, requiring job seekers to adapt their strategies accordingly. Opportunities lie in competitive niches, while the broader market remains inaccessible without German. The focus should be on long-term German language investment and targeted networking to break through barriers and achieve integration.

5. Conclusion

This paper examines whether Berlin’s reputation as an international, English-friendly city matches the linguistic requirements of its job market for non-German professionals. Results show a gap between perception and reality: proficiency in German remains a key, often mandatory, requirement across many industries. Despite Berlin’s marketing as multicultural and English-friendly, with minimal German required, most job listings are not in English, and German fluency is often a prerequisite. This challenges the notion that English proficiency alone is sufficient for employment outside niche sectors, such as expatriate tech startups.

Additionally, the survey results highlight this mismatch, with 88% of respondents reporting job application rejections due to limited German skills. Only 12% found

employment without fluency in German, mainly in the hospitality and IT sectors. This supports the idea that language proficiency is strongly linked to better job market outcomes.

The study reveals a gap between the expectations of non-German-speaking professionals before relocating to Berlin and their actual job market experiences. Three of the four hypotheses were confirmed, with the fourth—regarding students and early-career professionals facing more language barriers—left for future research due to space limitations. Overall, German language skills are a significant barrier to entry, underscoring the need for a clearer understanding of the linguistic demands in Berlin’s job market.

These findings suggest that policymakers and city branding should better align Berlin’s international image with its labor practices. Improving communication about language expectations can help manage talent’s expectations. Universities and career services may enhance German language support to prepare international students for the workforce. Employers seeking diverse talent may want to reconsider their German-language requirements or provide in-house training. Future research could focus on sector-specific analyses or employer perspectives for a more detailed understanding of language-based hiring barriers in Berlin.

Appendices

Appendix A: Online Survey

Survey Title: Working in Berlin without (fluent) German language skills

Privacy Protection Notice / Datenschutzhinweis

A comprehensive privacy protection notice was provided in both English and German. The notice outlined that the survey “is part of a university research project on language requirements in Berlin’s job market. Participation is voluntary, and all responses will be anonymous and treated confidentially, in accordance with the EU General Data Protection Regulation (GDPR).” Respondents were also informed that we will collect “demographic information (e.g. age, education level, field of study) and your experiences with job searching in Berlin,” and that the results will be used “for academic purposes only and will not be shared with third parties. No personally identifying information (such as names, emails, or IP addresses) will be collected or stored.” Respondents were informed of their right to withdraw their participation at any time and that proceeding with the survey confirmed they were at least 18 years old and gave informed consent for the use of their responses in this academic study.

Questionnaire

1. Privacy Protection Notice acceptance (Required)

Note: Those who disagreed with the notice were unable to continue with the rest of the survey’s questions

2. Gender (Required)

- (a) Man
- (b) Woman
- (c) Non-binary
- (d) Prefer not to say

3. Age (Required)

- (a) < 18
- (b) 18-25
- (c) $26 - 35$
- (d) $36 - 45$
- (e) > 55
- (f) Prefer not to say

4. Living district (Required)

- (a) Mitte, Berlin (incl. Wedding)
- (b) Friedrichshain-Kreuzberg, Berlin
- (c) Pankow, Berlin
- (d) Charlottenburg-Wilmersdorf, Berlin
- (e) Spandau, Berlin
- (f) Steglitz-Zehlendorf, Berlin
- (g) Tempelhof-Schöneberg, Berlin
- (h) Neukölln, Berlin
- (i) Treptow-Köpenick, Berlin
- (j) Marzahn-Hellersdorf, Berlin
- (k) Lichtenberg, Berlin
- (l) Reinickendorf, Berlin
- (m) Potsdam
- (n) Brandenburg
 - Other (open-ended)

5. “Which educational degree are you working towards, or have completed?”
(Required)
- (a) Bachelor’s Degree
 - (b) Master’s Degree
 - (c) Doctorate Degree
 - Other (open-ended)
6. “What degree are you studying?” (Required)
- (open-ended response)
7. “What university are you currently / have most recently studied at?” (Required)
- (open-ended response)
8. “What industries are you looking to work for?” (Required, multi-selection)
- (a) Education
 - (b) Government
 - (c) Public Service
 - (d) IT (Information Technology)

– (open-ended response)

Segmentation & Collection

- The survey link and a brief explanation were sent by email or WhatsApp group message to expatriates/migrants who live or study in the Berlin Metropolitan Area.
- Respondents were required to sign in to a valid Microsoft account to submit the form. This was to prevent more than one response per respondent. No Microsoft account details, email addresses, or other personal information were collected except for those specifically mentioned in the questionnaire.
